1 Introduce

This Article

This article is the user manual for the IP-XX series products. It also includes the application notes for how to use ATCOM products to build a telephony system for small office. Through this article, we hope that users can build the IP telephony system via IP-XX series products. *The IP-XX series PBXs include IP01, IP02, IP04, IP08 and IPBRI so far, since they have almost the same software and structure so we will use IP04 as the demo unit on this article. Same method is available to the IP-XX series products.*

IP01, IP02 ,IP04, IP08 & IP-BRI

The IP-XX series PBXs are open source embedded IP PBX systems. They run uClinux and Asterisk and support rich IP PBX features. They have big advantages on its inherent open source software structure and ultra low power consumption (<5 watt in idle state, environment friendly).

Model No.	RJ45	TEL Ports	RS232 Port	Others	Size(mm)	
IP-01	1	1 x fxo/fxs	1 fix RS232 port		100 x 100 x 28	
IP02	2	2 x fxo/fxs	1 RS232 module		100 x 100 x 28	
IP-04	1	4 x fxo/fxs	1 RS232 module	MMC	225 x 120 x 30	
IP-08	2	8 x fxo/fxs	1 RS232 module	MMC,USB	225 x 120 x 30	
IP-BRI	1	4 x BRI TE	1 fix RS232 port	MMC	225 x 120 x 30	

Below are the difference between the IP01, IP04 and IP08 platform.

2 Configure the device via GUI

2.1 Access the GUI

The IP04 GUI is immigrated from Asterisk Now 2.0 version. The default IP for IP04 is 192.168.1.100. Put the default ip in your web browser and it will redirect to the setting page of IP04, the default password for the web access is:

Username: admin Password: mysecret

If you can't access the IP04, please check if you have connect the RJ45 cable to the WAN port and your computer is in the same network 192.168.1.xxx as the IP04.

Note: the recommend web browser of IP04 is Firefox.

2.2 System Status

When you have entered the IP04 setting page, the system status will be showed and you can see the system status as below:

stem Status 🐠						
			System	Status		
		Uptime : 1	15:38:26 up 22:4	4, load average: 0.00,	0.00, 0.00

2.4 Trunks

Trunks are used to make outbound call to the real world. There are different trunks we can set here.

Tanage Analog trunks	φ	
Analog Trunks	Service Providers VOIP Trunks T1/	E1/BRI Trunks
+ New Analog Trunk	Analog	Ports
Ports 1	1	Edit XDelete
Ports 2	2	Edit 🗶 Delete
Ports 3	3	Edit 🗶 Delete
Ports 4	4	Edit 🗶 Delete

We have put the IP04 with four FXO ports so there are four analog trunks in this setting page. VoIP trunks (SIP&IAX2) are also available in the IPXX.

Analog Trui C	reate New SIP/IAX trunk		
+ New SIP/I	Type:	SIP 🖕	
g	Provider Name 🕕:	voipbuster	
ľ	Hostname :	sip.voipbuster.com	
	Username :	test	
	Password :	XXXXXXX	
		Cancel Mdd	

More info about how to set up the trunks, please refer the application notes.

2.5 Outgoing Calling Rules

Outgoing Calling Rules defines the calling permission sand the routing rules when making calls.

Tew Calli:	ew CallingRule			X	
in outgo ifferent set a fa	Calling Rule Pat — 🔲 Send to Local Destinatio Destinati	ttern 🛈 :	•	a 1	different patterns to be dialed throu low-cost SIP trunk). You can optional outgoing call rules. See the Dial Pla ound dialing.
	 Send this call through trund Use Trund Strig and Prepend these digit 	k (Î) p (Î) digits :	from front e dialing		Edit X Delete Edit X Delete Edit X Delete
	 Use FailOver Trunk ① : fail over Trun Strij and Prepend these digit 	k (1) p (1) digits :	from front e dialing		Edit X Delete Edit X Delete Edit X Delete Edit X Delete Edit X Delete
		⊘ Cancel 	Save		Edit X Delete Edit X Delete
	port4_9	_9.	Ports 4	Ports 1	Edit 🗶 Delete

Calling Rule Name: The name of your calling rule

> <u>Pattern</u>: Describe what numbers should use this rule:

- X ... Any Digit from 0-9
- Z ... Any Digit from 1-9
- N ... Any Digit from 2-9

[12345-9] ... Any Digit in the brackets (in this example,

1,2,3,4,5,6,7,8,9

. ... Wildcard, matches anything remaining; i.e. _9011. Matches

anything starting with 9011 (excluding 9011 itself)

 $! \dots$ Wildcard, causes the matching process to complete as soon as it

can unambiguously determine that no other matches are possible

For example, the extension _NXXXXX would match normal 7

digit numbers, while _1NXXNXXXX would represent a three

digit area code plus phone number, proceeded by a one.

- > <u>Use/Trunk</u>: Describe which trunk should be used in this rule
- Strip: Define how many digits should be removed from the dialstring.

Two samples for calling rule setting:

 Cut the first digit for all dialstring start with 9, and make outgoing call via port1: Calling Rule Name: Out_9 Pattern: _9. Use/Trunk: Ports 1 Strip: 1 digits from the front In this case, if you dial 983018806 in your extension, 83018806 will be sent via port1

2) Cut the first digit for all dialstring start with 0, and prepend 86 then dial via voipbuster trunk.

Calling Rule Name: Out_voipbuster Pattern: _0. Use/Trunk: Voipbuster Strip: 1 digits from the front And prepend these digits <u>86</u> In this case, if you dial 075583018806 in your extension, 8675583018806 will be sent via voipbuster trunk

2.6 Dial Plans

A Dial Plan is a collection of Outgoing Call Rules. Dial Plans are assigned to Users to specify the dialing permissions they have. For example, you might have one Dial Plan for local calling that only permits users of that Dial Plan to dial local numbers, via the "local" outgoing calling rule. Another user may be permitted to dial long distance numbers, and so would have a Dial Plan that includes both the "local" and "longdistance" outgoing calling rules.

2.7 Users

This page allow administrator to create extensions for every user.

General:

Extension: The number you can dial to reach this user.

Name: CallerID name of the user.

CallerID: The CID string when you dial to other internal users.

Outbound CallerID: Specify the public CallerID for outbound calls, it is only available when your digital or voip provider support this feature.

VoiceMail:

Voicemail Access PIN code: The password of your voicemail box Email address: The email address for the voicemail to email function.

Technology:

SIP: enable this option so the extension can be a SIP device.

IAX2: enable this option so the extension can be an IAX2 device.

Analog Station: If you have analog FXS ports in your IP04, you can select the port here for your extension.

flash/rxflash: flash parameter for the users.

Codec preference: specify the preference codec for the users.

Voip Setting:

MAC address: used for polycom phone provisioning.

Line Number: used for polycom phone provisioning.

Linekeys: used for polycom phone provisioning.

SIP/IAX2 password: user password for SIP/IAX2 registration.

NAT: enable this when you use the IP04 in public network and the sip devices are in private network.

Can Reinvite: enable this and the IP04 will try to negotiate the endpoints to route the

media string directly (not through IP04). This can reduce the CPU load of the IP04 and you will get better voice performance because the media string are sent directly from endpoint to endpoint.

DTMF mode: DTMF uses on conversation, the RFC2833 is the most common. Insecure: method of authentication,

Other Options:

3-Way Calling: enable/disable 3-way calling

In directory: check this if the user is listed in the directory.

Call waiting: enable/disable Call waiting

CTI: Computer Telephony Integration, allows access to 3rd party applications over Asterisk Manager Interface.

Is Agent: check this if the user is available in call queue.

Pick up Group: Specify the call pick up group.

2.8 Ring Groups

Define the Ringroups to dial more than one extension simultaneously, or to ring more than one phone sequentially.

2.10 Call Queues

Call queues allow calls to be sequenced to one or more agents.

ι γ		
Jeues Hew Queue		X
eate Ne Extension : 6500 1 Name :	(Ì)	
Strategy : ringall 🗸 🕕 Music On Hold : default 🗸 🕕		
LeaveWhenEmpty : No V JoinEmpty : Yes V		
Queue Options:		
TimeOut: 15 🛈 Wrapup Time: 15 🛈 Max Len: 0 🛈		
🔲 🛈 Auto Fill 👘 🚺 Auto Pause 🔲 🛈 Report Hold Time		
KeyFress Events : None 🗸 🛈		
Agents: ① You do not have any users defined as agents ! <u>click here</u> to manage users.		
🚫 Cancel 🗹 Update		

- Extension: This option defines the numbered extension that may be dialed to reach this Queue.
- <u>Name</u>: This option defines a name for this Queue, i.e. "Sales". 'Name' is a label to help you see this queue in the queue list.
- \triangleright <u>Strategy</u>: This option sets the Ringing Strategy for this Queue. The options are RingAll: Ring All available Agents simultaneously until one answers. RoundRobin: Take turns ringing each available Agent. LeastRecent: Ring the Agent which was least recently called FewestCalls: Ring the Agent with the fewest completed calls. Random: Ring a Random Agent. RRmemory: RoundRobin with Memory, Remembers where it left off in the last ring pass. Agents: This selection shows all Users defined as Agents in their User conf. Checking a \geq User here makes them a member of the current Queue. \triangleright Music On Hold: Select the 'Music on Hold' Class for this Queue. 'Music on Hold' classes can be managed from the 'Music On Hold' panel. LeaveWhenEmpty: This option controls whether callers already on hold are forced out \triangleright of a queue that has no agents. There are three options. Yes: Callers are forced out of a queue when no agents are logged in. No: Callers will remain in a queue with no agents. Strict: Callers are forced out of a queue with no agents logged in, or if all logged in agents are unavailable. \triangleright <u>Join Empty</u>: This option controls whether callers can join a call queue that has no agents. There are three options, Yes: Callers can join a call queue with no agents or only unavailable agents No: Callers cannot join a queue with no agents

Strict: Callers cannot join a queue with no agents or if all agents are unavailable. <u>Queue Options</u>:

11/

- <u>Timeout</u>: How many seconds an Agent's phone will ring before the Queue tries to ring the next Agent.
- Wrapup Time: How many seconds after the completion of a call an Agent will have before the Queue can ring them with a new call. The default is 0, which is no delay.
- MaxLen: How many calls can be queued at once. This count does not include calls that have been connected with Agents, it only includes calls that have not yet been connected. Default is 0, which is no limit. When the limit has been reached, a caller will hear a busy tone and advance to the next calling rule after attempting to enter the queue.
- <u>AutoFill</u>: Defining this option causes the Queue, when multiple calls are in it at the same time, to push them to Agents simultaneously. Thus, instead of completing one call to an Agent at a time, the Queue will complete as many calls simultaneously to the available Agents.
- <u>AutoPause</u>: Enabling this option pauses an agent if they fail to answer a call. This means that the agent is still logged into the queue, but they will not receive calls from the queue. Once paused, an agent can unpause by logging into the queue using the regular agent login extension.
- <u>Report Hold Time</u>: Enabling this option causes Asterisk to report, to the Agent, the hold time of the caller before the caller is connected to the Agent.
- KeyPress Events: If a caller presses a key while waiting in the queue, this setting selects which voice menu should process the key press.

Queues 🔅

General Voicemail Settings:

- Extension for checking Message: This option, i.e. "2345" defines the extension that Users call in order to access their voicemail accounts.
- Direct VoiceMail Dial: Check this to enable direct voicemail dial. For instance, if John's extension is 6001, you would be able to directly dial into John's voicemailbox by dialing #6001 to leave him a message.
- Max Greeting:Set the maximum number of seconds for a User's voicemail greeting.
- <u>Dail 'O' for Operator</u>: Enable Callers to exit the voicemail application and connect to an operator extension. The operator extension must be defined from the 'Options' panel.
- Maximum messages per folder: This select box sets the maximum number of messages that a user may have in any of their folders.
- Maximum Message Time: This select box sets the maximum duration of a voicemail message in seconds. Message recording will not occur for times greater than this amount.
- Minimum message Time: This select box sets the minimum duration of a voicemail message in seconds. Messages below this threshold will be automatically deleted.
- Say Message Caller-ID: If this option is enabled, the Caller ID of the party that left the message will be played back before the voicemail message begins playing.
- Say Message Duration (in minutes): If this option is set, the duration of the message in minutes will be played back before the voicemail message begins playing.
- Allow callers to Review: Checking this option allows the caller to review their message before it is submitted as a new voicemail message.
- Play Envelope: Turn on/off playing introductions about each message when accessing them from the voicemail application.

16/

Voicemail to Email: with this function configured, when there is a new voicemail for users, the ip04 will automatically send the voicemail to the user's email address set in the user's profile.

HTTP and TFTP update is available for the firmware update.

- > <u>TFTP server</u>: TFTP server which include the update firmware
- File Name: name of the new firmware, please make sure that you are using a md5 firmware for the updating.
- Reset Configs: enable this if you want to reset the networking and asterisk configs after upgrade.

2.26 Advance Options—File Editor

Here you can modify the asterisk configure files directly.

Note: Please make sure you know what the meaning in the files before trying to modify these files.

3 Application notes

3.1 Install hardware

The IPXX series IP PBXs use interchangeable FXO/FXS modules. The FXO and FXS signaling use different modules. Below are the available modules for the system.

Avaiable Modules						
Photo	Description	Suitable Products				
	one channel FXO module	IP01,IP02,IP04 and IP08				
	one channel FXS module	IP01,IP02,IP04 and IP08				
	dual channel FXO module	IP02 and IP08				
	dual channel FXS module	IP02 and IP08				

FXO: use to connect to the PSTN line FXS: use to connect to the analog phone.

Install illustration:

1) IP01 with one FX0

2) IP04 with two fxo two fxs modules.

3.2 Different methods to access the IPxx

There are several ways to access the IPXX series products. Different ways has different usage. The web/SSH/telnet accesses are base on network connection, and the console port access is via the console cable which allows you to access the devices on a lower level.

Web access

It is the most common way to access the IPxx. Most settings can be done through the web interface. Simply put the device's IP address in your web browser (better use Firefox) and enter the username and password to access the device. The web access username/password is **admin/mysecret**

SSH access

This is the advance way to access the device, you can use the putty software to access the device. in the ssh access, you can access the Linux directly and do more advance linux setting and debug. The SSH user/password is **root/uClinux**

Telnet access

The telnet access is similar with the SSH access but it is not suggested because it is not as convenient as SSH access.

Console access

The console access is used mainly for develope purpose or in the case when network is down.

Below are the connections pictures for console access For IP01 & IP02

For IP04

Below is the console port setting to access the IPXX Running the Hyper Terminal or Minicom in your computer to connect the IP04, the setting of the console port should be:

26/

Bits per second to 115200; Data bits : 8 Parity: None Stop bits: 1 Flow control: None

3.3 Make free internal calls

Making internal calls are the base requirement for a telephony system. Below are the settings for this usage. It is base on IP04 but setting is the same in other IPXX products. <u>System Setup</u>

At the beginning, we need to add some extensions to make internal calls. Each extension acts as an internal number. There are three types of extensions we can add: SIP, IAX2 and ZAP.

Before set up the extensions, we need to go to the **Options --> General Preferences** to set the user extensions range. The default user extensions range is from 6000~6299. The extension 6000 is used for auto-attendant so don't register on this extension.

eneral Preferences 💠						
General Preferences	Language	Change Pas	sword	R	eboot	Advanced Options
	Global Out	Bound CID 🕕				
	Global OutBour	-				
Operator Extension 🛈 : 💽						
Ring Timeout 🛈 : 20						
Extension preferences:						
	User H	Extensions :	6000	to	6299	
	Conference I	Extensions :	6300	to	6399	
			7000		7100	
		Extensions :			6499	
		Extensions :			6599	
Vo	iceMail Group H	Extensions : Reset to defaul	_	to	6699	
		neset to defaul				
	○ Car	ncel 🗹 Save				

Then go to page Dial Plan-->Create New Dialplan to create a default Dial Plan.

www.atcom.cn

Then go to page Users-->Create New User to create the extensions: 6001

Use the same method to add the extensions: 6002, 6003 and 6004. In our system picture, we use softphone x-lite to register on 6001 and 6002. Use AT-530 IP phone to register on the extensions 6003 and 6004. Then these four extensions can communicate with each other use the numbers 6001, 6002, 6003 and 6004.

3.4 Make outbound calls to PSTN

There are many kinds of trunking you can use to make outgoing calls. It includes: Analog FXO trunk, Digital E1/T1/BRI Trunk, SIP trunk, IAX trunk etc.

3.4.1 Analog/FXO trunking

For the IP01/04/08, you can install FXO module and use the FXO trunking to make outgoing call via your local PSTN line. The set up is as per below:

Outgoing Call To PSTN Network

Step 1: Create FXO trunk

Go to page Trunks--> Add New Analog Trunk

New Analo		Channels:	✓ 1 ✓ 2		
	Т	unk Name 🛈 : 🕽	PSTN		
		∆d	wanced Options		
	Busy Detection 🛈 :	Yes 🕌		Busy Count 🛈 :	3
	Busy Pattern 🛈 :	500, 500		Ring Timeout 🛈 :	8000
	Answer on Polarity Switch 🛈 :	No 🗸	Pol	Hangup on arity Switch 🛈 :	No 🕌
	Call Progress 🛈 :	No 🗸	P	rogress Zone 🛈 :	US 🗸
	Use CallerID 🛈 :	Yes 🗸	Cal	ler ID Start 🛈 :	Ring 🗸
	CallerID 🛈 :	As Received 🗸		Pulse Dial 🛈 :	No 🗸
	CID Signalling 🛈 :	Bell - USA	•	mailbox :	-
	Flash Timing 🛈 :	750	Receive	Flash Timing 🛈 :	1250

Note: The port1 and port2 of IP04 are slotted with FXO modules. Always click "Apply Changes" in the right top corner when you do some changes.

Step 2: Create Outgoing Calling Rules

30/

Go to page Outgoing Calling Rules.

nage Callin	g Rules 🔶	
+ New Calli	New CallingRule X	
An outgo different a failover	Calling Rule Name ① : OUT_PSTN Pattern ① : _9. Send to Local Destination ① Destination : Send this call through trunk: Use Trunk ① PSTN - Strip ① 1 digits from front and Prepend these digits ① before dialing	/s diff low-co going c: md dia
	Use FailOver Trunk ① : fail over Trunk ① , Strip ① digits from front and Prepend these digits ① before dialing	

The pattern _9. and strip 1 digits means all calls start with 9 will be cut the first digit and sent out via this rule. for example, if you dial 983018049, the ip04 will send 83018049 to port1 or port2.

Step 3: Add New DialPlan

Go to page Dial Plans--> Crear New Dial Plans

alPlans	φ.	
+ New Dial	Create New DialPlan	X
A Dial H	DialPlan Name:	DialPlan1
you migh rule. And		♥ OUT_PSTN
	Include Local Contexts:	♥ default ♥ parkedcalls ♥ conferences ♥ ringgroups ♥ voicemenus ♥ queues ♥ voicemailgroups ♥ directory ♥ pagegroups ♥ page_an_extension
		Save Save

Set the DialPlan1 to default dial plan so every new extension will use this dialplan in default. Then you can use your extensions to dial out via the port1 and port2.

3.4.2 VoIP trunking

Via the voip trunking we can dial call via the voip service to reduce our cost when making international calls.

Step 1: Add Voip trunks

Go to page Trunks--> Voip Trunks--> Add New Sip trunks

Provider Name ①: voipbuster Hostname : sip.voipbuster.com Username : aniceman Password : ******	gTru Create New SIP/IAX trunk SIP/I Type:	SIP 🖵	X
Username : aniceman Password : *****	Provider Name (1):	voipbuster	
Password : *****	Hostname :	sip.voipbuster.com	
	Username :	aniceman	
	Password :		
Cancel Add		S Cancel	

We use the Voipbuster as our voip service provider here.

Step 2: Add voip calling rule

Go to page Outgoing Calling Rules.

www.atcom.cn

▶ New Calli:	New CallingRule	X
An outge lifferent a failoven	Calling Rule Name ① : Out_VoIP Pattern ① : _00. Send to Local Destination ① Destination : Send this call through trunk: Use Trunk ① voipbuster . Strip ① 2 digits from front and Prepend these digits ① before dialing	rs d: low point nd d
	Use FailOver Trunk fail over Trunk Strip digits from front and Prepend these digits before dialing	

All calls start with 00 will be sent out via our voip service provider.

Step 3: Add this new calling rule to the dial plan1

All extensions which use dialplan1 are able to use the voipbuster service now

3.5 Combine the IP04 with exist traditional PBX

Introduce:

Assume that we already have a (3-8 3fxo 8extensions) traditional PABX in our office and we want to add more pstn lines/extensions or use voip solution in the exist solution. We can combine the IP04 with the exist PABX solution use below structure.

1/ Connect the FXO port of the PABX to IP04's FXS port. so the PABX will be one of the IP04's FXS extensions and all the extensions under pabx can use all the fxs functions from IP04, the functions include:

make calls to the ip04's other extensions make calls use the ip04 voip trunk make PSTN via ip04's PSTN trunk

2/ Connect the FXS port for the PABX to IP04's FXO port. So the IP04 will be one of the PABX extensions and all the extensions under pabx can use all the fxs functions from pabx, the functions include:

make calls to the pabx's other extensions make PSTN via pabx's PSTN trunk

3.6 Intercommunication between two IPXX

Introduce:

This application note shows how to link two IP04 in different location. With this function, we can link branches together with IP04. Same method can be used when connect more than 2 IP04 in different branches.

3.6.1 Link two IP04s in the same network

The simplest case to link two IPxx together is in the same network. We start from this and then try to expand to different network. We use IP04 here, same method for other IPXXs products.

Below is the structure of how to link two IP04s in the same LAN:

The method of connecting two IP04s in different location is: 1) register the IP04A as an extension in IP04B(via IAX2 trunk) so the extensions in IP04A can make calls to IP04B's extensions via this "special" trunk. 2) use the reverse method in IP04B to register to IP04A.

In above structure:

- 1) AT-530A registers to IP04A as an extension 6001.
- 2) AT-530B registers to IP04B as an extension 5001.
- 3) All the extensions under IP04A are in the format 6XXX.
- 4) All the extensions under IP04B are in the format 5XXX
- 5) Extensions under IP04A can make calls to extension under IP04B use format 5XXX.
- 6) Extensions under IP04B can make calls to extension under IP04A use format 6XXX.
- 7) The two IP04 links each other via IAX2 trunk.

Step 1: Set up a extension 6005 in IP04A

Extension:	6005 ; Phone number of this extension
Name:	User_IP04B ;
Password:	6005 ;IAX2 Log on password
Caller ID:	6005 ; Caller ID

Step 2: Set up an IAX trunk in IP04B to link to IP04A via this User_IP04B extension. In the page Trunks--> Add Voip Trunk

SIP/I	Provider Name 🛈:	To_IP04A		
	Hostname :	192.168.1.21		
	Username :	6005		
	Password :	6005		
	Codecs :	First : u-law - Second Fourth : 6.726 - Fifth	Third : GSM 🕌	
	CallerID 🛈 :			
	FromDomain :			
	FromUser :			
	insecure :	no 👻		

Step 3: Set Calling Rule in IP04B, all calls start with 6 will be sent to IP04A. In the page: Outgoing Calling Rules--> Add New Calling Rule

Edit Calling Rule
Calling Rule Name ① : Out_IPO4A
Pattern ① : _6.
🕝 🔟 Send to Local Destination 🛈 —
Destination :
Send this call through trunk:
Use Trunk 🛈 To_IF044 🕌
Strip ① 0 digits from front
and Prepend these digits ① before dialing
🗖 Use FailOver Trunk 🛈 :
fail over Trunk () To_TF044
Strip ① digits from front
and Prepend these digits ① before dialing

Step 4: Add this new calling rule "Out_IP04A" to the exist dial plan. In the page: DialPlan --> Edit DialPlan1

Plans 9		
New Dials	Edit DialPlan	
A Dial Pl	DialPlan Name:	DialPlan1
you might		
ule. Anot	Include Outgoing Calling Rules:	Ølout_IP04A
Defau		✓ default ♥ parkedcalls ♥ conferences ♥ ringgroups ♥ voicemenus ♥ queues ♥ voicemailgroups ♥ directory ♥ pagegroups ♥ page_an_extension
		O Cancel Save

Active the change and apply the test:

www.atcom.cn

1/Register an IP phone AT-530B to IP04B with 5001 extension.

2/Register an IP phone AT-530A to IP04A with 6001 extension.

3/Use 5001 to dial 6001. And you can see 6001 is ringing and you can pick up the calls.

Above is the way to router IP04B's call to IP04A, the method to link IP04A to IP04B is the same as above.

3.6.2 Link two IP04s in different location

The generally environment for two ip04 in different location is: two IP04 are both behind router and using the private IP.

Since the IP04 doesn't have the public IP, we need to do port forwarding in the router and make IP04 is reachable to others.

Step 1: Set port forwarding in the router for IP04A

The IP04A is behind the router, to register to IP04A via the internet, you need to forward the IAX2 port in your router, so all the packets received on the router WAN port (202.8.16.98:4569) will be forwarded to the IP04A (192.168.1.21:4569). Below is the setting page in a linksys router:

Applications & Gaming	Setup Security Applica & Gam							
	Port Range Fi	orwarding	1		rt Triggering	UPnl	P Forwarding	DMZ
UPnP Forwarding								UPnP Forwarding
	Application	Ext.Port	тср	UDP	Int.Port	IP Address	Enabled	UPnP Forwarding can be us
	FTP	21	۲	0	21	192.168.1.0		to set up public services on your network. When users
	Teinet	23	۲	0	23	192.168.1.0		the Internet make certain requests on your network,
	SMTP	25	۲	0	25	192.168.1.0		Router can forward those requests to computers equi
	DNS	53	0	۲	53	192.168.1.0		to handle the requests. If, for example, you set the port number 80 (HTTP) to be
	TFTP	69	0	۲	69	192.168.1.0		forwarded to IP Address 192.168.1.2, then all HTTP
	finger	79	۲	0	79	192.168.1.0		requests from outside users be forwarded to 192 168 1.
	HTTP	80	۲	0	80	192.168.1.199		is recommended that th computer use static IP
	POP3	110	۲	0	110	192.168.1.0		address.
	NNTP	119	۲	0	119	192.168.1.0		You may use this function to establish a Web server or F

	httpl	8080	۲	0	80	192.168.1.29	~	that you enter a valid IP Address. (You may need to
	http2	8090	۲	0	80	192.168.1. 209		establish a static IP address with your ISP in order to properly run an Internet ser-
	IAX	4569	۲	0	4569	192.168.1.21		For added security,
	IAX2	4569	0	۲	4569	192.168.1.21		More

38/

Step 2. Set up the service provider and calling rule in IP04B to make it register to IP04A. This method is almost the same as above, EXCEPT you need to use the 202.8.16.98 as the service provider instead of 192.168.1.21.

Step 3. Use the same method do port forwarding in routerB for IP04B. Your public address from network provider maybe a dynamic ip which will be changed periodically. To overcome the problem of dynamic ip, you may need to use the DDNS service , for more info please google the internet.

3.7 Voicemail to Email Configure example

The IP04 will send a notify Email to your mail box when you have set up the Voicemail to Email function.

	Send messages by e-mail only ① Attach recordings to e-mail ① Template for Voicemail Emails
	edwin@atcom.com.cn
Subject	You've got new Voicemail from \${VM_CALLERID}
Message	New Voicemil from \${VM_CALLERID}:

2) Configure your SMTP server
